

During my Masters I have done several projects and one of the project that I would like to discuss is NurseForCare. This project is very close to me as I developed this project for the society welfare during the pandemic. As during the covid situation it is very difficult for anyone to get treatment or consultancy from any hospital because of lock-down and social distancing.

The application I developed is a hybrid application which runs on any platform.

The main purpose of this app is to provide in-home nursing services, vaccination and other Medical Services to a specific user as a user can book services and can get personal assistance and caring from the hospital to their home only.

There are several apps available which provide in-home nursing services but this app is different from others app as it provide the services on the same day as it gets booked and it acts as a mediator between the user and the local medical vendors or hospital as this app provides the opportunity to the local medical vendors or hospital to get register and be a part of the system.

This app basically shows the available services to the user based on their location. and after booking the services the app will sends the user location to the hospital and the hospital will provide the services.
